HDF5 DAOS VOL Connector User's Guide

Jordan Henderson, Neil Fortner, Jerome Soumagne

This document aims to be a helpful guide on how to use the HDF5 DAOS VOL connector to leverage the capabilities of the DAOS object storage system within an HDF5 application.

Contents

1. Using the DAOS VOL connector with an HDF5 application

This section outlines the unique aspects of writing, building and running HDF5 applications with the DAOS VOL connector.

1.1. Writing HDF5 DAOS VOL connector applications

Any HDF5 application using the DAOS VOL connector must:

1. Include `daos_vol_public.h`, found in the `include` directory of the DAOS VOL connector installation directory.
2. Link against `libhdf5_vol_daos.so` (or similar), found in the `lib` directory of the DAOS VOL connector installation directory.

An HDF5 DAOS VOL connector application also requires three new function calls in addition to those for an equivalent HDF5 application (see Appendix A for more details):

- `H5daos_init()` - Initializes the DAOS VOL connector

  Called upon application startup, before any file is accessed.

- `H5Pset_fapl_daos()` - Set DAOS VOL connector access on File Access Property List.

  Called to prepare a FAPL to open a file through the DAOS VOL connector. See HDF5 File Access Property Lists for more information about File Access Property Lists.

- `H5daos_term()` - Cleanly shutdown the DAOS VOL connector

  Called on application shutdown, after all files have been closed.

1.1.1. Skeleton Example

Below is a no-op application that opens and closes a file using the DAOS VOL connector. For clarity, no error-checking is performed.

```
#include "hdf5.h"
#include "daos_vol_public.h"

int main(void)
{
    hid_t fapl_id;
    hid_t file_id;

    H5daos_init(MPI_COMM_WORLD, pool_uuid, NULL);

    fapl_id = H5Pcreate(H5P_FILE_ACCESS);
    H5Pset_fapl_daos(fapl_id, MPI_COMM_WORLD, MPI_INFO_NULL);
    file_id = H5Fopen("my/file.h5");

    /* operate on file */

    H5Pclose(fapl_id);
    H5Fclose(file_id);

    H5daos_term();

    return 0;
}
```

1.2. Building HDF5 DAOS VOL connector applications

Assuming an HDF5 application has been written following the instructions in the previous section, the application must be built prior to running. In general, the application should be built as normal for any other HDF5 application.

To link in the required libraries, the compiler will likely require the additional linker flags:

```
-lhdf5_vol_daos -luuid
```

However, these flags may vary depending on platform, compiler and installation location of the DAOS VOL connector. It is highly recommended that compilation of HDF5 DAOS VOL connector applications be done using the `h5cc/h5pcc` script, as it will manage linking with the HDF5 library. If HDF5 was built using Autotools, this script will be called `h5pcc` and may be found in the `bin` directory of the HDF5 installation. If HDF5 was built with CMake, this script will simply be called `h5cc` and can be found in the same location. The above notice about additional library linking applies to usage of `h5cc/h5pcc`. For example:

```
h5cc/h5pcc -lhdf5_vol_daos -luuid my_daosvol_application.c -o my_executable
```

1.3. Running HDF5 DAOS VOL connector applications

Running applications that use the HDF5 DAOS VOL connector requires access to a server which implements the DAOS API. Refer to DAOS Quick Start Guide for more information on the setup process for this.

1.3.1. Runtime Environment

For the DAOS VOL connector to correctly interact with a DAOS API-aware server instance, there are two environment variables which should first be set. These are:

```
DAOS_POOL - The UUID of the DAOS pool to use

DAOS_SVCL - A comma-separated list of MPI ranks used for daos_pool_connect().
            Currently, for simple 1 MPI rank operations this should simply be
            specified as DAOS_SVCL=0
```

1.3.2. Example Applications

The file `test/daos_vol/test_daos_vol.c` contains several test functions that are examples of applications in miniature, focused on a particular behavior. These mini-applications test a moderate amount of HDF5's public API functionality with the DAOS VOL connector and should be a good indicator of whether the DAOS VOL connector is working correctly in conjunction with a running HDF5 DAOS API-aware instance.

In addition to this file, some of the example C applications included with HDF5 distributions have been adapted to work with the DAOS VOL connector and are included under the top-level `examples` directory in the DAOS VOL connector source root directory.

2. HDF5 Feature support

2.1. HDF5 API support

The following sections serve to illustrate the DAOS VOL connector's support for the HDF5 API, as well as to highlight any differences between the expected behavior of an HDF5 API call versus the actual behavior as implemented by the VOL connector. If a particular HDF5 API call does not appear among these tables, it is most likely a native HDF5-specific API call which cannot be implemented by non-native HDF5 VOL connectors. These types of API calls are listed among the tables in Appendix B.

2.1.1. H5A interface

Supported API calls

API call	Notes
H5Acreate(1/2)	
H5Acreate_by_name	
H5Aopen(_by_name)	
H5Aopen_name	
H5Awrite	
H5Aread	
H5Aclose	
H5Aiterate(2)	■ Restarting iteration from an index value is currently unsupported ■ Only `H5_ITER_NATIVE` is supported for the iteration order
H5Aiterate_by_name	■ Restarting iteration from an index value is currently unsupported ■ Only `H5_ITER_NATIVE` is supported for the iteration order
H5Aexists(_by_name)	
H5Aget_name	
H5Aget_space	
H5Aget_type	
H5Aget_create_plist	

Currently unsupported API calls

API call	Notes
H5Aopen_by_idx	Currently no support for attribute creation order
H5Aopen_idx	Currently no support for attribute creation order
H5Arename(_by_name)	
H5Adelete(_by_name/_by_idx)	
H5Aget_info(_by_name/_by_idx)	
H5Aget_name_by_idx	Currently no support for attribute creation order
H5Aget_storage_size	

2.1.2. H5D interface

Supported API calls

API call	Notes
H5Dcreate(1/2)	
H5Dcreate_anon	
H5Dopen(1/2)	
H5Dwrite	
H5Dread	
H5Dclose	
H5Diterate	
H5Dget_space	
H5Dget_type	
H5Dget_create_plist	
H5Dget_access_plist	

Currently unsupported API calls

API call	Notes
H5Dflush	
H5Drefresh	
H5Dextend	
H5Dset_extent	
H5Dget_storage_size	
H5Dget_space_status	Space status is currently always set to H5D_SPACE_STATUS_NOT_ALLOCATED
H5Dget_offset	
H5Dvlen_reclaim	
H5Dvlen_get_buf_size	
H5Dscatter	
H5Dgather	
H5Dfill	

2.1.3. H5F interface

Supported API calls

API call	Notes
H5Fcreate	
H5Fopen	
H5Freopen	
H5Fis_accessible	
H5Fget_create_plist	
H5Fget_access_plist	
H5Fget_intent	
H5Fget_name	
H5Fget_obj_count	
H5Fget_obj_ids	
H5Fclose	

Currently unsupported API calls

API call	Notes
H5Fflush	
H5Fmount	
H5Funmount	

2.1.4. H5G interface

Supported API calls

API call	Notes
H5Gcreate(1/2)	
H5Gcreate_anon	
H5Gopen(1/2)	
H5Gclose	
H5Gget_create_plist	
H5Gget_info(_by_name/_by_idx)	Of the four fields in the `H5G_info_t` struct: ■ `storage_type` is always set to `H5G_STORAGE_TYPE_UNKNOWN` ■ `nlinks` is set appropriately ■ `max_corder` is currently always set to 0 ■ `mounted` is currently always set to `FALSE` `H5Gget_info_by_idx` is currently unsupported due to the lack of support for link creation order
H5Gget_num_objs	
H5Glink(2)	Currently only soft link creation is supported

Currently unsupported API calls

API call	Notes
H5Gflush	
H5Grefresh	
H5Gmove(2)	Will be supported once `H5Lmove` is supported
H5Gunlink	Will be supported once `H5Ldelete` is supported
H5Gget_linkval	Will be supported once `H5Lget_val` is supported
H5Gget_objname_by_idx	Will be supported once `H5Lget_name_by_idx` is supported

2.1.5. H5L interface

Supported API calls

API call	Notes
H5Lcreate_soft	
H5Lexists	
H5Literate(_by_name)	■ Restarting iteration from an index value is currently unsupported ■ Only `H5_ITER_NATIVE` is supported for the iteration order

Currently unsupported API calls

API call	Notes
H5Lcopy	
H5Lmove	
H5Lcreate_hard	
H5Lcreate_external	
H5Lcreate_ud	
H5Ldelete(_by_idx)	
H5Lget_info(_by_idx)	
H5Lget_name_by_idx	Currently no support for link creation order
H5Lget_val(_by_idx)	
H5Lvisit(_by_name)	
H5Lregister	
H5Lunregister	
H5Lis_registered	
H5Lunpack_elink_val	

2.1.6. H5O interface

Supported API calls

API call	Notes
H5Oopen	
H5Oopen_by_addr	
H5Oclose	

Currently unsupported API calls

API call	Notes
H5Oopen_by_idx	
H5Oexists_by_name	
H5Ovisit(1/2)	
H5Ovisit_by_name(1/2)	
H5Olink	
H5Ocopy	
H5Oflush	
H5Orefresh	
H5Oincr_refcount	
H5Odecr_refcount	

2.1.7. H5R interface

Supported API calls

API call	Notes

Currently unsupported API calls

API call	Notes
H5Rcreate	
H5Rdereference(1/2)	Causes an assertion failure
H5Rget_name	
H5Rget_obj_type(1/2)	
H5Rget_region	

2.1.8. H5T interface

Supported API calls

API call	Notes
H5Tcommit(1/2)	
H5Tcommit_anon	
H5Topen(1/2)	
H5Tclose	
H5Tget_create_plist	

Currently unsupported API calls

API call	Notes
H5Tflush	
H5Trefresh	

3. Testing

3.1. HDF5 and dynamically-loaded VOL connectors

HDF5 has the capability to dynamically load and use a VOL connector for running tests with. While several HDF5 tests have been updated to take advantage of this capability, please be aware that many of these tests are likely to fail or crash due to their native HDF5-specific nature.

In order to choose a particular VOL connector to use for testing, two initial steps must be taken. First, one must help HDF5 locate the VOL connector by pointing to the directory which contains the built library. This can be accomplished by setting the environment variable `HDF5_PLUGIN_PATH` to this directory. Next, HDF5 needs to know the name of which library to use, which is configured by setting the environment variable `HDF5_VOL_CONNECTOR` to the name of the connector.

In order to use the DAOS VOL connector, the aforementioned environment variables should be set as:

```
HDF5_PLUGIN_PATH=/daos/vol/installation/directory/lib
HDF5_VOL_CONNECTOR=daos
```

Having completed this step, HDF5 will be setup to load the DAOS VOL connector and use it for testing.

3.2. Testing the DAOS VOL connector

3.2.1. Generic VOL connector test suite

In order to test VOL connectors to make sure that they are functioning as expected, a suite of tests which only use the public HDF5 API has been written. This suite of tests is available under the path:

```
test/vol/vol_test.c
```

Currently, this test suite does not have the capability to query what kind of functionality a VOL connector supports and therefore a test will fail if it uses an HDF5 API call which is not implemented, or which is specifically unsupported, in a given VOL connector.

To test the DAOS VOL connector with this test suite, first refer to Starting the DAOS Server and Runtime Environment to make sure that the DAOS Server is up and running and your environment is setup correctly. Once that is done, tests can be run against the DAOS VOL connector and it should be as simple as running:

```
make check
```

for Autotools builds, or:

```
ctest .
```

for CMake builds[1].

3.2.2. DAOS VOL connector-specific test suite

There is no DAOS specific test as of this writing.

[1] Automated testing is still under development for CMake builds.

A. Reference Manual

A.1. H5daos_init

```
herr_t H5daos_init(MPI_Comm pool_comm, uuid_t pool_uuid, char *pool_grp);
```

Purpose:

Initialize the DAOS VOL connector.

Description:

`H5daos_init` initializes the VOL connector by connecting to the pool and registering the connector with the library. `pool_comm` identifies the communicator used to connect to the DAOS pool. This should include all processes that will participate in I/O. This call is collective across `pool_comm`.

Parameters:

`MPI_Comm pool_comm`	IN: Communicator used for connecting to the pool
`uuid_t pool_uuid`	IN: UUID to identify a pool
`char *pool_grp`	IN: Process set name of the DAOS servers managing the pool

Returns:

Returns a non-negative value if successful; otherwise returns a negative value.

A.2. H5daos_term

```
herr_t H5daos_term(void);
```

Purpose:

Terminate the DAOS VOL connector.

Description:

`H5daos_term` terminates the DAOS VOL connector.

Parameters:

None.

Returns:

Returns a non-negative value if successful; otherwise returns a negative value.

A.3. H5Pset_fapl_daos

```
herr_t H5Pset_fapl_daos(hid_t fapl_id, MPI_Comm comm, MPI_Info info);
```

Purpose:

Set the file access property list to use the DAOS VOL connector.

Description:

`H5Pset_fapl_daos` modifies the file access property list to use the DAOS VOL connector. `file_comm` and `file_info` identify the communicator and info object used to coordinate actions on file create, open, flush, and close.

Parameters:

`hid_t fapl_id`	IN: File access property list ID
`MPI_Comm file_comm`	IN: MPI Communicator
`MPI_Info file_info`	IN: MPI Info

Returns:

Returns a non-negative value if successful; otherwise returns a negative value.

B. Native VOL connector API calls

The following HDF5 API calls are specific to the native HDF5 VOL connector and thus are not able to be implemented by the DAOS VOL connector (or other VOL connectors):

B.1. H5A interface

API call	Notes
H5Aiterate1	Deprecated in favor of H5Aiterate2
H5Aget_num_attrs	Deprecated in favor of H5Oget_info

B.2. H5D interface

API call	Notes
H5Dformat_convert	
H5Dget_chunk_index_type	
H5Dget_chunk_storage_size	
H5Dread_chunk	
H5Dwrite_chunk	

B.3. H5F interface

API call	Notes
H5Fis_hdf5	Uses a default FAPL so can only ever be routed through the native HDF5 VOL connector
H5Fget_vfd_handle	
H5Fget_freespace	
H5Fget_filesize	
H5Fget_file_image	
H5Fget_mdc_config	
H5Fset_mdc_config	
H5Fget_mdc_hit_rate	
H5Fget_mdc_size	
H5Freset_mdc_hit_rate_stats	
H5Fget_info(1/2)	
H5Fget_metadata_read_retry_info	
H5Fget_free_sections	
H5Fclear_elink_file_cache	
H5Fstart_swmr_write	
H5Fstart_mdc_logging	
H5Fstop_mdc_logging	
H5Fget_mdc_logging_status	
H5Fset_libver_bounds	
H5Fformat_convert	
H5Freset_page_buffering_stats	
H5Fget_page_buffering_stats	
H5Fget_mdc_image_info	
H5Fget_eoa	
H5Fincrement_filesize	
H5Fget_dset_no_attrs_hint	
H5Fset_dset_no_attrs_hint	
H5Fset_latest_format	
H5Fset_mpi_atomicity	
H5Fget_mpi_atomicity	

B.4. H5G interface

API call	Notes
H5Gset_comment	Deprecated in favor of H5Oset_comment/H5Oset_comment_by_name
H5Gget_comment	Deprecated in favor of H5Oget_comment/H5Oget_comment_by_name
H5Giterate	Deprecated in favor of H5Literate
H5Gget_objinfo	Deprecated in favor of H5Lget_info/H5Oget_info
H5Gget_objtype_by_idx	Deprecated in favor of H5Lget_info/H5Oget_info

B.5. H5L interface

API call	Notes

B.6. H5O interface

API call	Notes
H5Oget_info(1/2)	
H5Oget_info_by_name(1/2)	
H5Oget_info_by_idx(1/2)	
H5Oset_comment(_by_name)	Deprecated in favor of using attributes on objects
H5Oget_comment(_by_name)	Deprecated in favor of using attributes on objects
H5Oare_mdc_flushes_disabled	
H5Oenable_mdc_flushes	
H5Odisable_mdc_flushes	

B.7. H5R interface

API call	Notes

B.8. H5T interface

API call	Notes
